INTRODUCTION The Connecticut Department of Transportation (ConnDOT) uses historical accident data as an important component in its ongoing evaluation of Connecticut's public highways, streets and roads. Accident data play an integral role in ConnDOT's responsibility for maintaining the state highway system, and is a key factor in the decision-making process for improving roadways and modifications. The ConnDOT Environmental Planning Authority uses accident data as an important tool in the analysis of state roads; is often the main component of the purpose and need of environmental documents. Road modification planning includes reviewing available accident records and analysing accident frequencies and trends to determine whether a change of road would Safety. REQUIREMENTS STATE STATUS The Accident Records and Statistics Section of the Office for Inventory and Forecasting is responsible for codifying, maintaining and compiling data on motor vehicle accidents. Section 14-108a of the Connecticut Motor Vehicle Act, Title 14, requires any police officer, agency or individual who investigates reported motor vehicle accidents to forward one copy of the ConnDOT accident report after the investigation is complete. A reported motor vehicle accident is defined as an accident in which any person is killed or injured or injured or in which damage to the property of any person in excess of a thousand dollars is sustained. ACCIDENT RECORDS PRODUCTS The following is a brief overview of some major accident reports and summaries produced in the Accident Records and Statistics: Road Accident Surveillance Report (TASR). This report, which is produced over the last 3-year period available, shows the total number of accidents, the number of traffic accidents, accidents and various road functions for the entire state highway system. For each national road position, the TASR shall display the position characteristics, the total safeness of the accidents, the number of vehicles passing through the site, the million kilometres of driving of the vehicle, the average accident rate for a given type of site, the actual accident rate at that location, the critical accident rate at that location and the ratio of the actual accident rate to the critical accident rate. TASR is sorted by route and cumulative mileage. Proposed list of supervisory study sites (SLOSSS). This is based on TASR data, which recorded an unusually high accident rate over the three-year period concerned. Each TASR site with 15 or more accidents whose actual accident rate is higher than the critical accident rate is included in SLOSSS. SLOSSS displays similar information to TASR, with the addition of a sequence number used to evaluate locations according to the ratio of actual accident rate to critical accident rate. SLOSSS is sorted by route and cumulative mileage as well as by serial number. The aim of the development of SLOSSS is to define those sites that have the greatest promise of reducing the number of accidents, thereby providing a broad range of overall needs to improve road safety. Q-Factors. This is a report that shows injury and fatal accident factors by group of roads and types of intersections for state roads. Q-Factors, which is produced over a 3-year period, displays fatal accidents, injuries, property damage only accidents, deaths, injuries, accident totals, and cost factors derived from accident and death costs reported annually to the National Security Council. Before and after studies. In conjunction with the annual safety report prepared by conndot's transport engineering division, pre- and post-accident frequency studies are regularly carried out on safety improvement projects to evaluate their cost-effectiveness. The annual safety report is submitted annually to the Federal Road Administration (FHWA). Experience of

the accident. This is the history of accidents for a specific location and time period, which describes in detail the dynamics of each accident. These are prepared daily for various sources. Connecticut Accident Summary Table (CAST). These tables distribute the sums of accidents, vehicles and persons by the main fields contained in the ConnDOT database file. They can be made for any type of accident, as well as for any accident in the file. Connecticut Traffic Accident Facts. This report, which is published each year, contains data relating to motor vehicle accidents that have occurred on publicly maintained roads in Connecticut for a particular year. The report uses text, tables, charts, notes, and pictures to present data. The Connecticut Transportation Accident Facts Report is distributed to various organizations after its publication. THE FATALITY ANALYSIS REPORTING SYSTEM (FARS) The Accident Records and Statistics Section is also responsible for the Fatality Analysis Reporting System (FARS), a federal program that requires the collection of data on fatal motor vehicle accidents. The National Highway Traffic Safety Administration (NHTSA) is funding a cooperation agreement with ConnDOT to obtain data for FARS. FARS data is written to the designated computer and transferred to NHTSA at night. October 1998 Connecticut Department of Transportation Office of Inventory and Forecasting 2800 Berlin Turnpike P.O.
